

1. Scope of Work (SOW)

The scope of work covers the design, development, testing, and deployment of the **BNB Air Booking MVP**, a streamlined digital platform that enables users to search, book, and pay for vacation rentals and hotel rooms without any physical interaction. The MVP will establish the foundational booking engine, authentication system, property listing system, and a basic admin dashboard for managing listings through Jeremy's Choice Motels contract.

The primary objective of the MVP is to launch a functioning revenue-generating booking product as quickly as possible so that the larger vision of full automation, digital key access, and virtual video assistance can be funded by early bookings and user growth. The tasks included in this scope cover user account creation, property search, booking flow, secure payments, a simplified check-in process, an operational admin backend, and all essential system integrations required to onboard early properties and begin real-world operations.

2. MVP Overview

The **BNB Air Booking MVP** is a minimal yet functional version of the larger platform envisioned by Jeremy Shirley. While the long-term goal is a fully automated, discrimination-free booking ecosystem with digital locks, automated IDs, and 24/7 video assistance, the MVP centers on the core revenue-producing functionality: enabling users to browse properties, book rooms, and receive instant confirmation without needing to interact with hotel staff.

The MVP will provide a simple and intuitive user interface for guests while allowing the administrator to upload properties, manage inventory, and track bookings from the backend. The solution will be fast, lightweight, mobile-friendly, and built with scalability in mind so additional features can be integrated in Phase 2 and Phase 3 of development as funding increases.

3. MVP User Interface Features

3.1 User Registration & Account Creation

The registration screen allows new users to quickly create an account using their email, phone number, or a third-party sign-in method such as Google or Apple. The registration form gathers only the essential details required to activate an account: name, email, phone, and password. Once submitted, users receive a verification email or OTP code verifying their identity. After confirming their account, they are automatically signed in and directed to the home search screen.

3.2 User Login & Authentication

Returning users can log in using their registered email and password or through any integrated social sign-in options. The login process includes secure authentication protocols, failed attempt tracking, and password reset capabilities. Once authenticated, the system loads the user's dashboard including recent searches, upcoming bookings, and personalized recommendations.

3.3 Home Screen & Search Interface

Upon successful login, users land on a clean home screen featuring a prominent search bar where they can enter their destination, check-in date, and check-out date. The interface is designed to minimize friction by allowing users to type or use location suggestions. Below the search bar, the system displays featured properties, recommended stays, and promotional deals pulled from the admin backend. The home screen serves as the central hub for starting any new booking journey.

3.4 Property Listings & Search Results

After entering search criteria, users are shown a results page containing available properties that match their selected destination and dates. Each listing displays the nightly price, total stay cost, featured photos, and essential property information such as room type, capacity, amenities, and location. Users can sort listings by price or rating and can open any listing to view more details. The design prioritizes clarity and reduces clutter, ensuring every user can navigate listings with ease.

3.5 Property Details Page

When a user selects a property, they are taken to a detailed property page that provides a full photo gallery, written description, pricing breakdown, available room options, check-in instructions, cancellation policy, and the “Book Now” button. The page emphasizes transparency so that users feel confident making a booking without needing to speak to anyone. Once satisfied, the user clicks the booking button to proceed.

3.6 Booking Confirmation & Payment Screen

The booking screen displays the reservation summary including dates, price, total cost, and room selection. The user then enters payment information through a secure checkout process powered by Stripe, PayPal, or another integrated provider. The payment screen handles all authorization, fraud detection, and confirmation steps, ensuring industry-standard security. When payment is approved, the reservation is locked in and the user is forwarded to the confirmation screen.

3.7 Booking Receipt & Check-In Instructions

Immediately after a successful payment, the user receives an on-screen receipt followed by an email confirmation. The confirmation email includes the booking ID, hotel address, check-in time, and simplified check-in instructions tailored for the MVP. Depending on the property, users may receive either a standard front-desk check-in note or a preassigned room number with a code if available. The future phases will replace this with fully digital PIN or QR-based entry, but the MVP maintains a functional, simple solution that works today.

3.8 User Dashboard

Once a booking is made, the user dashboard updates to show upcoming stays, past bookings, and downloaded receipts. Users can revisit details at any time, review their reservation, or cancel when allowed. The dashboard is designed to grow over time as future features such as customer support, loyalty points, saved properties, and travel itineraries are added.

3.9 Account Settings

Users can access their personal information, update their email or phone number, change passwords, and enable notifications. The settings area ensures that users feel in control of their account while maintaining minimalism appropriate for the MVP stage.

3.10 Logout

The logout feature cleanly ends the user session, clears local authentication tokens, and returns the user to the welcome screen. This ensures privacy and security across shared or public devices.

4. 6-Month Revenue Forecast (Up to 5,000 Users)

Assumptions:

- Average commission per booking: **\$18** (based on Choice Motels contract ranges)
- Monthly active users grow from 200 to 5,000
- 8% of active users make a booking each month
- Average user books once per month
- MVP launch month = Month 1

MONTH	ACTIVE USERS	PAYING USERS (8%)	ESTIMATED REVENUE
MONTH 1	200	16	\$288
MONTH 2	600	48	\$864
MONTH 3	1,500	120	\$2,160
MONTH 4	3,000	240	\$4,320
MONTH 5	4,200	336	\$6,048
MONTH 6	5,000	400	\$7,200

Total 6-Month Forecast Revenue: \$20,880

With only the MVP active and no advertising budget, this revenue is sufficient to demonstrate traction and secure funding for Phase 2.

5. Development Timeline (MVP – 3 Months)

Month 1:

Foundational setup, UI/UX wireframes, database architecture, user authentication system, admin dashboard skeleton, and property upload functionality.

Month 2:

Full booking engine, payment integration, property listings, search functionality, property detail pages, check-in instruction system, and confirmations.

Month 3:

Testing, optimization, UI polish, admin controls, deployment to hosting, domain setup, production environment, and launch.

6. Milestone-Based Payment Timeline

Total MVP Cost: \$9,000

Initial Payment: \$3,000 at contract initiation

Remaining Balance: \$6,000 divided across milestones:

Milestone 1 – \$1,500

Completion of user authentication and admin dashboard foundation.

Milestone 2 – \$1,500

Completion of property search, listings, and property details screens.

Milestone 3 – \$1,500

Completion of full booking engine and payment gateway integration.

Milestone 4 – \$1,500

Final testing, launch readiness, deployment, and delivery of the live MVP.
